ST706 - Second Exam. Tuesday, May. 7 10-12. Two hour exam.

Coverage will begin with the multivariate methods for handling two-way mixed models on page 152 through the end of the course. You will however also need to know how the one-way random, two-way random and two-way mixed models can be treated as a general linear mixed model.

Obviously for the open book, while the questions will be focused on the material covered on pages 152 on, you will also may need some of the general tools and results from earlier in course and ST705.

The exam will have two parts.

- Closed book part. This will probably be brief than the midterm, maybe 20 minutes. For this you should know definitions and basic results and simple developments, but you shouldn’t be memorizing any complicated formulas.

- Open Book Part.

  This will be problem solving similar to what you have been doing in the homework. You can use your class notes, your homeworks and Ravishankar and Dey.
